

### Abstract of the Disclosure

There are provided low expansion transparent glass-ceramics obtained by heat treating a base glass produced at a relatively low melting temperature of 1530°C or below. The glass-ceramics have an average linear thermal expansion coefficient within a range from  $+6 \times 10^{-7}/^{\circ}\text{C}$  to  $+35 \times 10^{-7}/^{\circ}\text{C}$ , 80% transmittance wavelength ( $T_{80}$ ) of 700nm or below, internal transmittance of 75% or over at light wavelength of 1550nm, heat resisting temperature of 800°C or over and Young's modulus of 90 GPa or over. The glass-ceramics comprise  $\text{SiO}_2$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{MgO}$ ,  $\text{CaO}$ ,  $\text{BaO}$ ,  $\text{ZnO}$ ,  $\text{Li}_2\text{O}$ ,  $\text{TiO}_2$  and  $\text{ZrO}_2$  and contain  $\beta$ -quartz or  $\beta$ -quartz solid solution as a predominant crystal phase. There are also provided optical waveguide elements and an arrayed waveguide grating (AWG) type planar lightwave circuit utilizing these glass-ceramics.
